

PRODUCT DECK · SEPTEMBER 2026

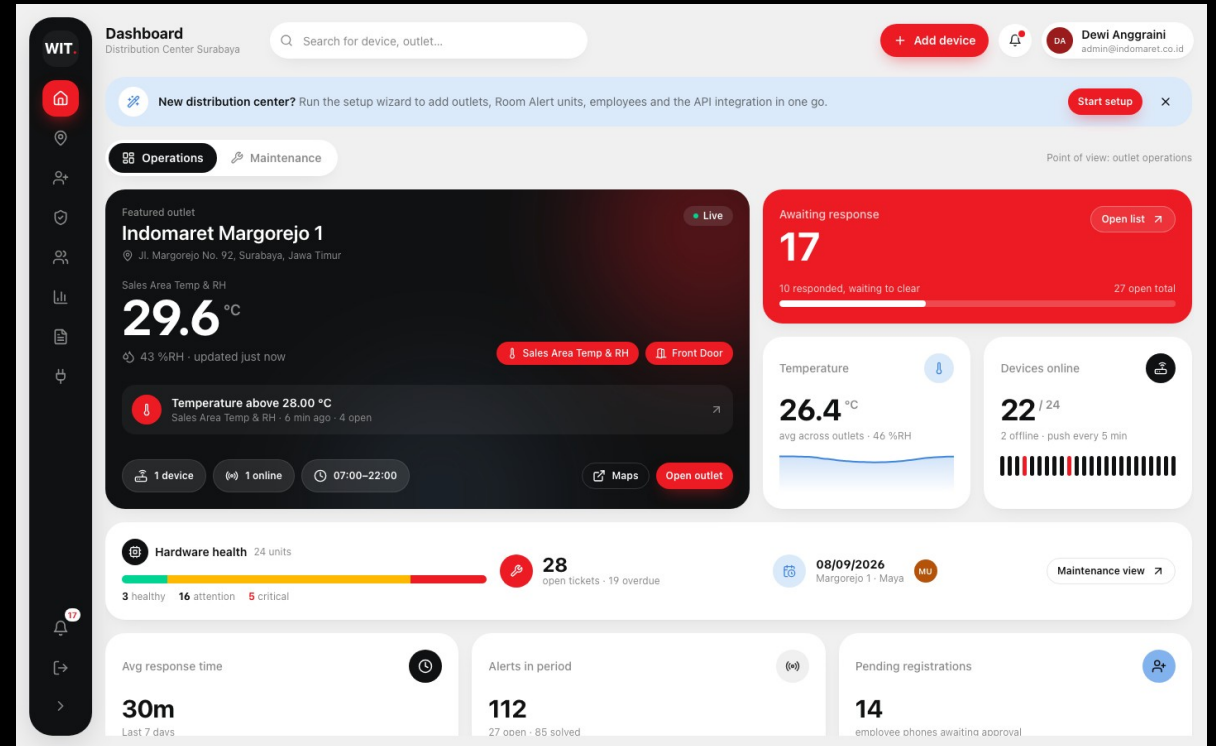

RA Monitor.

Realtime environment & security monitoring for every Indomaret outlet — Room Alert units, admin dashboard, employee mobile app and API blackbox in one product.

Admin dashboard

Mobile PWA

API blackbox

What this deck covers.

#	Section	What you will see
01	The problem	Environmental downtime, GSM/FWT pain points and why outlets need continuous monitoring
02	The solution	Room Alert units + WIT blackbox + admin dashboard + employee app + Telegram
03	Admin dashboard	Operations and maintenance points of view, alerts, analysis, reports
04	Shopfloor & devices	Outlet map, in-store floor plan, device management and full master data CRUD
05	Mobile app	Employee response with photo proof, technician tickets, PWA install
06	API blackbox & setup	Webhook / e-mail ingestion, request log, endpoint contract, setup wizard
07	Scale & roadmap	30 distribution centers, 21,000 outlets, delivery phases

30% of all downtime, data loss and damage an organisation faces is caused by environmental factors.

Every outlet already monitors its network. Almost none monitor temperature, humidity, doors and motion — until the cooler fails, the store is broken into after hours, or the power is cut.

Today at the outlet

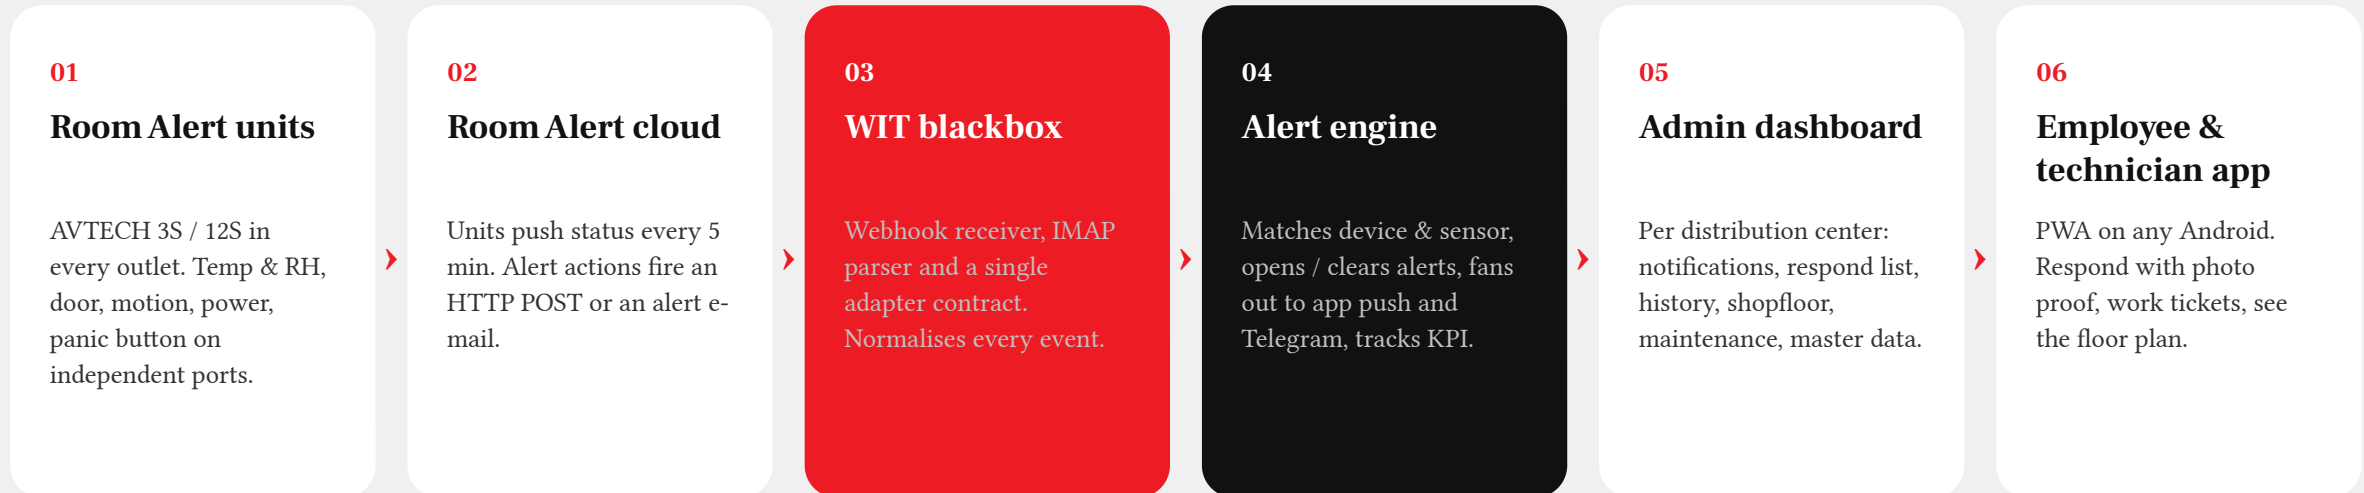

- Temperature written down by hand, no trend history
- Security alarm needs a GSM SIM card per outlet, topped up monthly
- Daily arm / disarm passkey — forgotten after hours
- Missed calls and Telegram from an FWT box, no field response tracking
- No way to see which sensor is abnormal

Existing security system vs RA Monitor

Parameter	Existing system	RA Monitor
Temperature & humidity	Manual log sheet	Realtime online, 24/7 trend history
Server connection	FWT + GSM SIM card per outlet	Building internet only, no SIM card
Arming / disarming	Daily passkey on site	One-time automatic schedule
Alert notification	Missed call + Telegram broadcast	App push with respond system + Telegram
Field response	Not tracked	Notes + photo proof, response time KPI
Hardware maintenance	Reactive	Health score, tickets, technician schedule
Where is it installed?	Unknown	Outlet map + in-store floor plan
Monthly cost	Rp 20–30k SIM per outlet + refills	Decreases as more outlets are connected

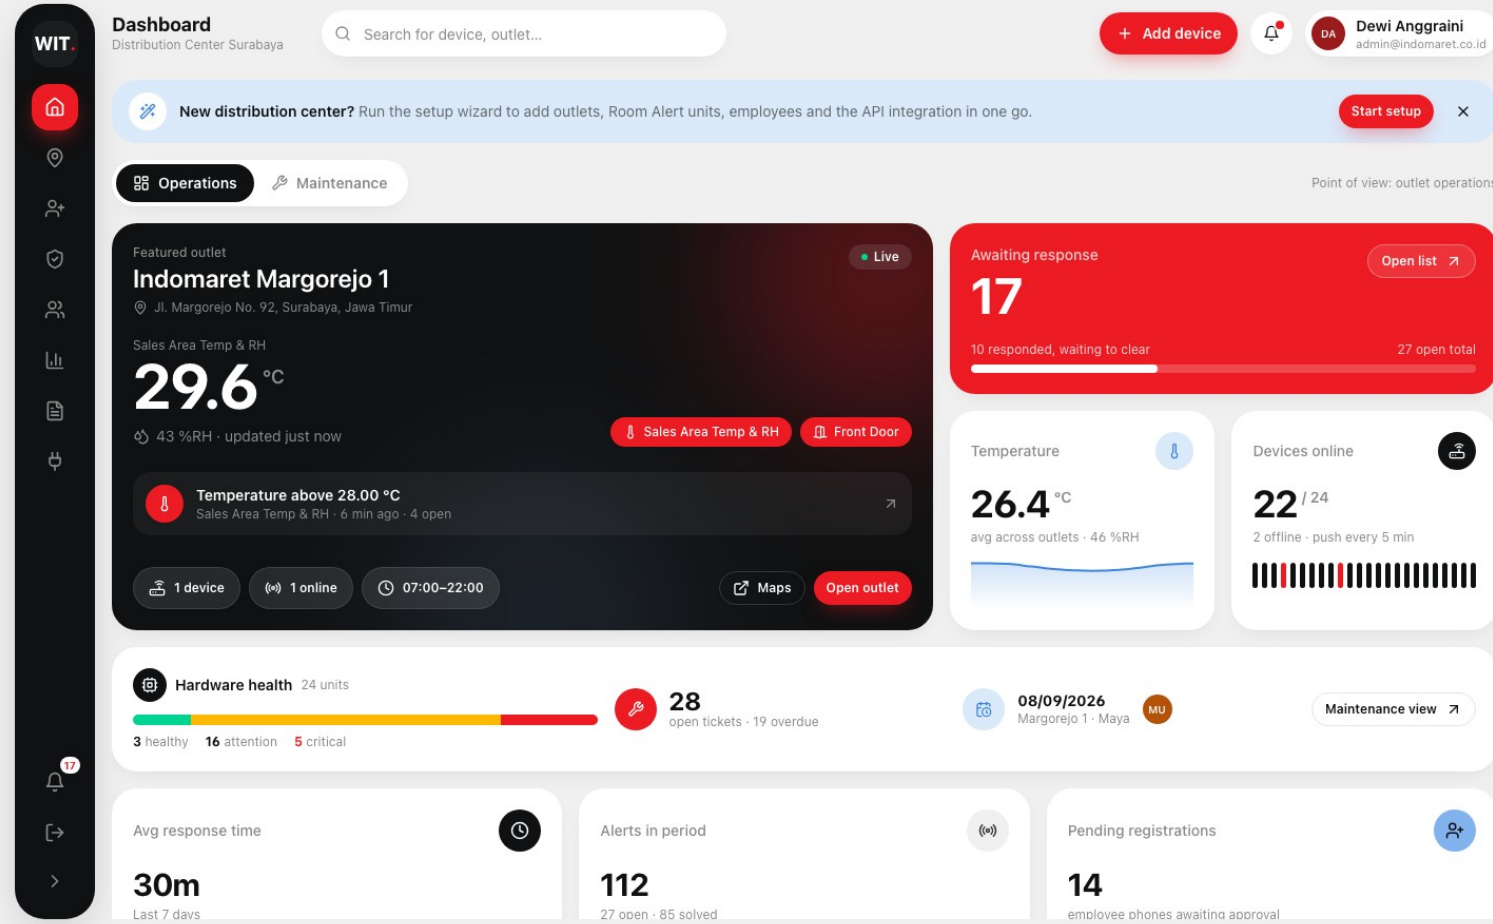

One stop solution: sensor to response in **seconds**.

Frontend delivered first, backend swapped in behind the blackbox

The dashboard and app run today on a seeded data set through the same adapter interface the backend will implement. Switching from mock to HTTP is a single toggle on the Integration page — no UI rewrite.

Everything a distribution center admin needs on one screen.

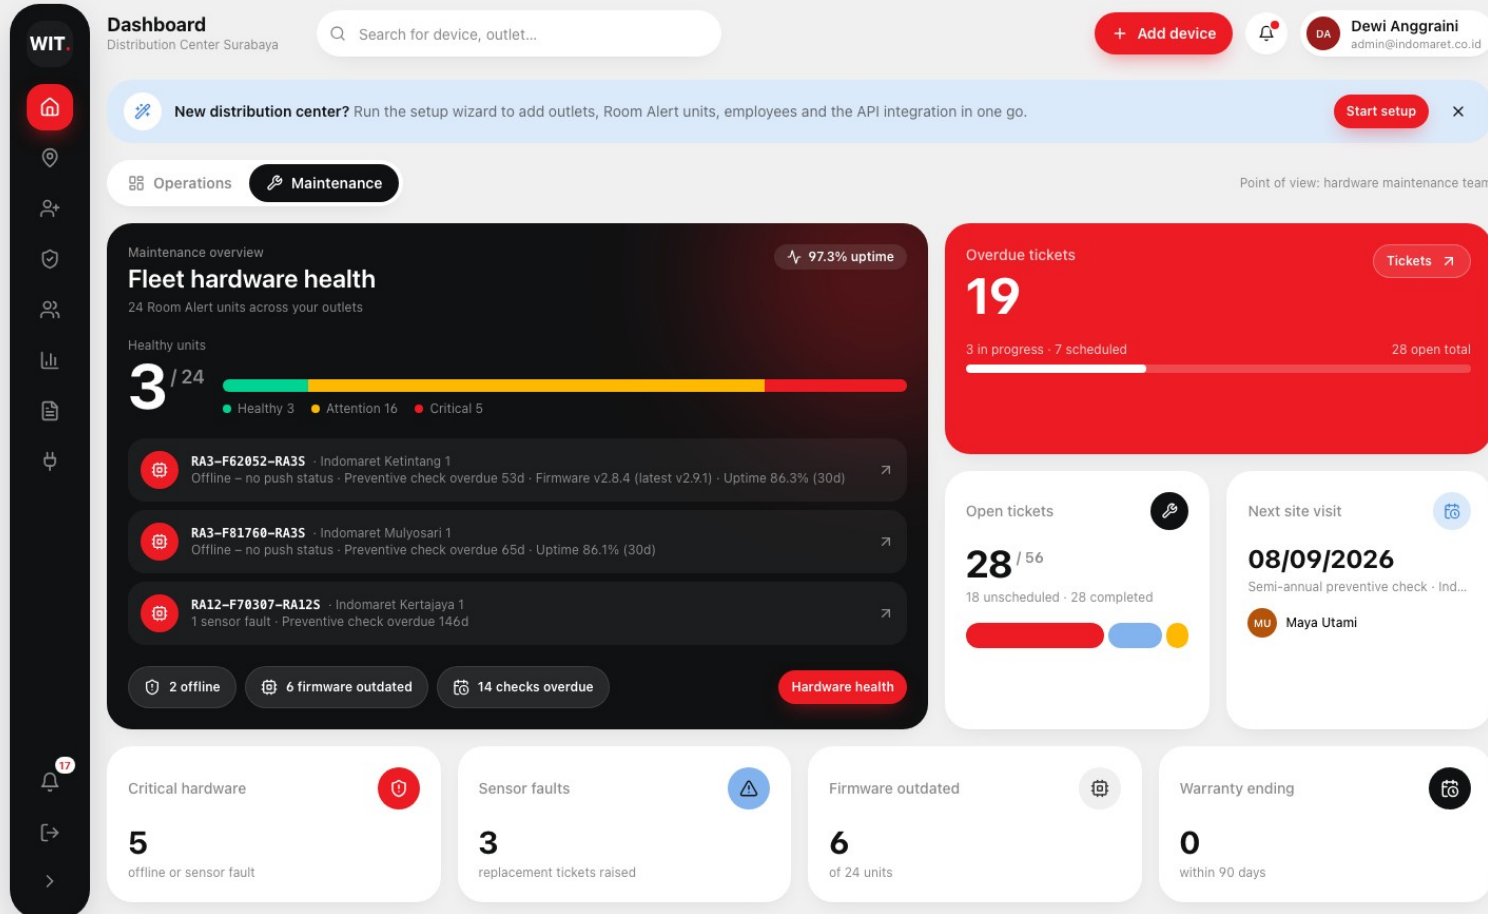

- Featured outlet with live temperature, humidity and sensor chips
- Awaiting-response counter with responded / open progress
- Fleet temperature trend and devices-online strip
- Open and solved alert lists with category filter, analysis donut and date range
- Hardware-health strip so maintenance is never out of sight
- Switchable point of view: Operations or Maintenance

WIT.ID design system

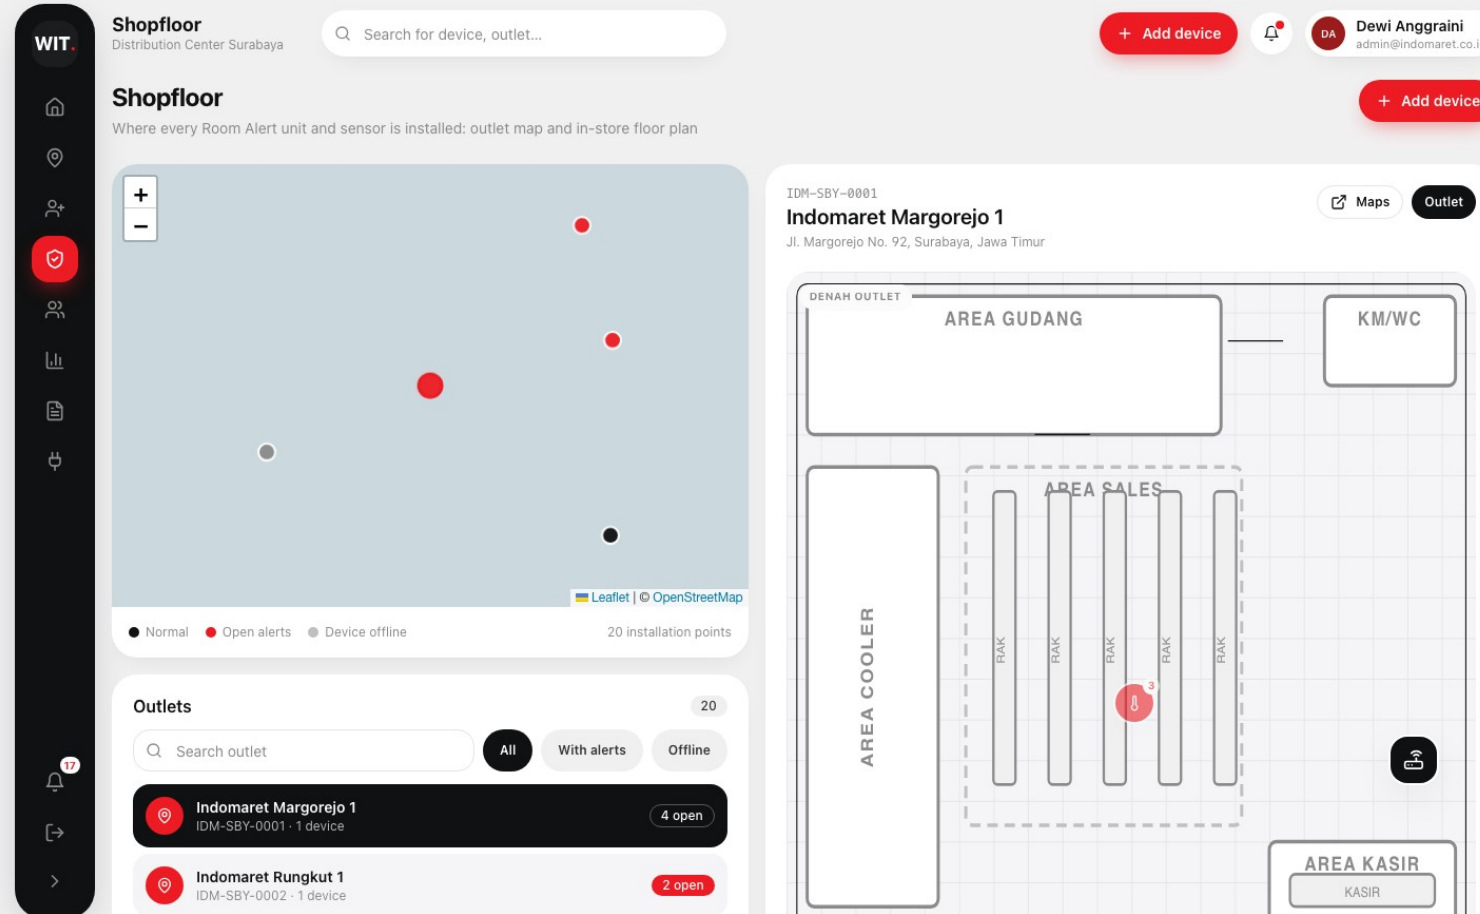

Expandable sidebar

Hardware health, tickets and technicians — **built in.**

- Health per unit derived from offline status, sensor faults, firmware, overdue checks, warranty and uptime
- Service tickets: preventive, corrective, replacement, firmware — with priority, schedule and status flow
- Technician assignment and workload, overdue visits highlighted
- Same view exists in the mobile app: technicians start and complete tickets with notes and photos
- Device Maintenance page: hardware health table, tickets, schedule by day, technician cards

Know exactly where every unit and sensor is installed.

- Outlet map (OpenStreetMap) with every installation point, coloured by open alerts and offline devices
- In-store floor plan drawn from the outlet layout: gudang, cooler area, racks, kasir, teras
- Markers for the Room Alert unit and each sensor, pulsing when an alert is open
- Click any point: readings, thresholds, alert history, parent device, raise a ticket
- Positions editable from Device master data; the same plan is shown in the mobile app

Full master data **CRUD** — outlets, units, sensors, people

The screenshot displays the 'Device Info' section for 'Distribution Center Surabaya'. It features a search bar, a status filter set to 'All status', and a user profile for 'Dewi Anggraini'. The main area is divided into two panels: 'Installation points' showing a shopfloor map with areas like 'AREA GUDANG', 'AREA COOLER', 'AREA SALES', and 'AREA KASIR', and 'Units at this outlet' showing details for unit 'RA3-F88156-RA35' with a status of 'Online'.

Outlets

Code, address, GPS, hours, time zone

Device types

Ports, built-in sensors, firmware, service interval

Devices

Register with default sensors, edit network & position, remove

Sensors

Type, port, thresholds, floor position

Employees

Roles, outlets, tokens, approval

Technicians

Specialty, mobile app token

Contact persons

Primary contact, Telegram channel

Tickets

Create, assign, schedule, complete

From trigger to KPI, no double response.

01
Triggered

Sensor exceeds its limit during operational hours (comfort) or after hours (security). Alert opens with ID, value and time.

02
Notified

Every registered employee at that outlet gets an app push; Telegram broadcast to contact persons; admin list updates.

03
Responded

First employee on site adds notes and photo proof. Others see the status — nobody responds twice.

04
Cleared

Room Alert reports the clear value, or an admin marks it cleared. Clear time recorded.

05
Measured

Response time per employee and outlet becomes a KPI in Analysis and the CSV report.

Alert list with Open / Responded / Cleared tabs, category and outlet filters, and a detail drawer with the field response and photo proof.

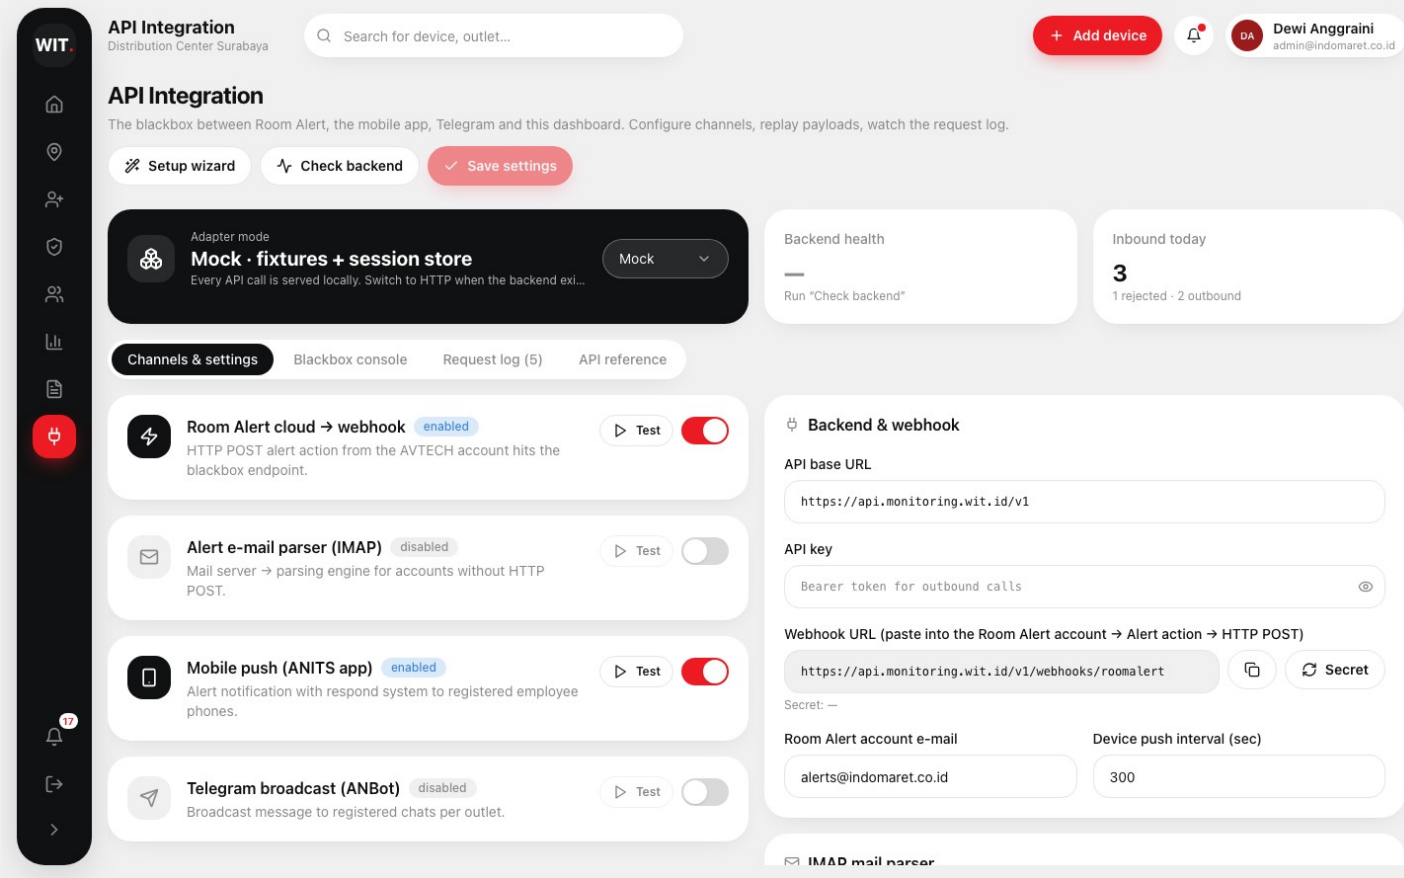

A PWA that feels native — installs from the browser.

- Login with e-mail + admin-issued token; employee or technician role
- Alerts: outlet filter, needs-response / responded / cleared, lazy-loading lists
- Alert detail: location, device, sensor, latest reading, ongoing time; respond with notes and camera photo
- Devices per outlet with health badge and the same floor plan
- Maintenance tab: hardware health, tickets, report an issue; technicians start and complete work with photos
- Installable, offline-ready shell, no app store needed

The **blackbox** between Room Alert, the app, Telegram and the dashboard

Method	Endpoint	Purpose
POST	/webhooks/roomalert	Room Alert HTTP POST action
POST	/webhooks/email	Parsed alert e-mail (IMAP)
GET	/distributors/{id}/alerts	Notification / respond / history
POST	/alerts/{id}/respond	Field response + photo
POST	/integrations/telegram/broadcast	ANBot broadcast
POST	/integrations/push/send	Employee push

- Channel cards with enable toggles and Test buttons
- Console: paste a webhook JSON or alert e-mail, parse, ingest into the live dashboard
- Request log of inbound and outbound calls
- Mock and HTTP adapters share one contract

A new distribution center is monitoring in minutes.

Distribution ce... Outlets Room Alert units Employees Integration Finish

Which distribution center is this dashboard for?

Name: Distribution Center Surabaya

Code: DC-SBY

City: Surabaya

Province / region: Jawa Timur

Address: Jl. Raya Industri No. 39, Surabaya

Signed in as adm-001 - this center can monitor up to 700 outlets.

← Back Continue →

01 Distribution center

Name, code, city, region

02 Outlets

Quick rows: code, name, address

03 Room Alert units

Model and sensors per outlet with port-capacity check

04 Employees

Tokens generated for the mobile app

05 Integration

API URL, key, webhook secret, Telegram / IMAP

06 Finish

Records created — go to dashboard or floor plans

Designed for the **whole network**.

30

distribution centers across Indonesia, one admin dashboard each

700

outlets per distribution center, ~21,000 nationwide

5

employees per outlet notified on the app — first to respond closes the loop

5 min

push status interval; offline units flagged, power loss detected immediately with a power sensor

Modern, maintainable, ready for the backend phase.

Admin dashboard

- Vite + React + TypeScript
- Tailwind v4, WIT.ID tokens
- Recharts analysis
- Leaflet outlet map
- CSV export

Mobile PWA

- Same React stack
- vite-plugin-pwa (installable, offline shell)
- Camera photo proof
- Lazy-loading lists
- iPhone demo frame on desktop

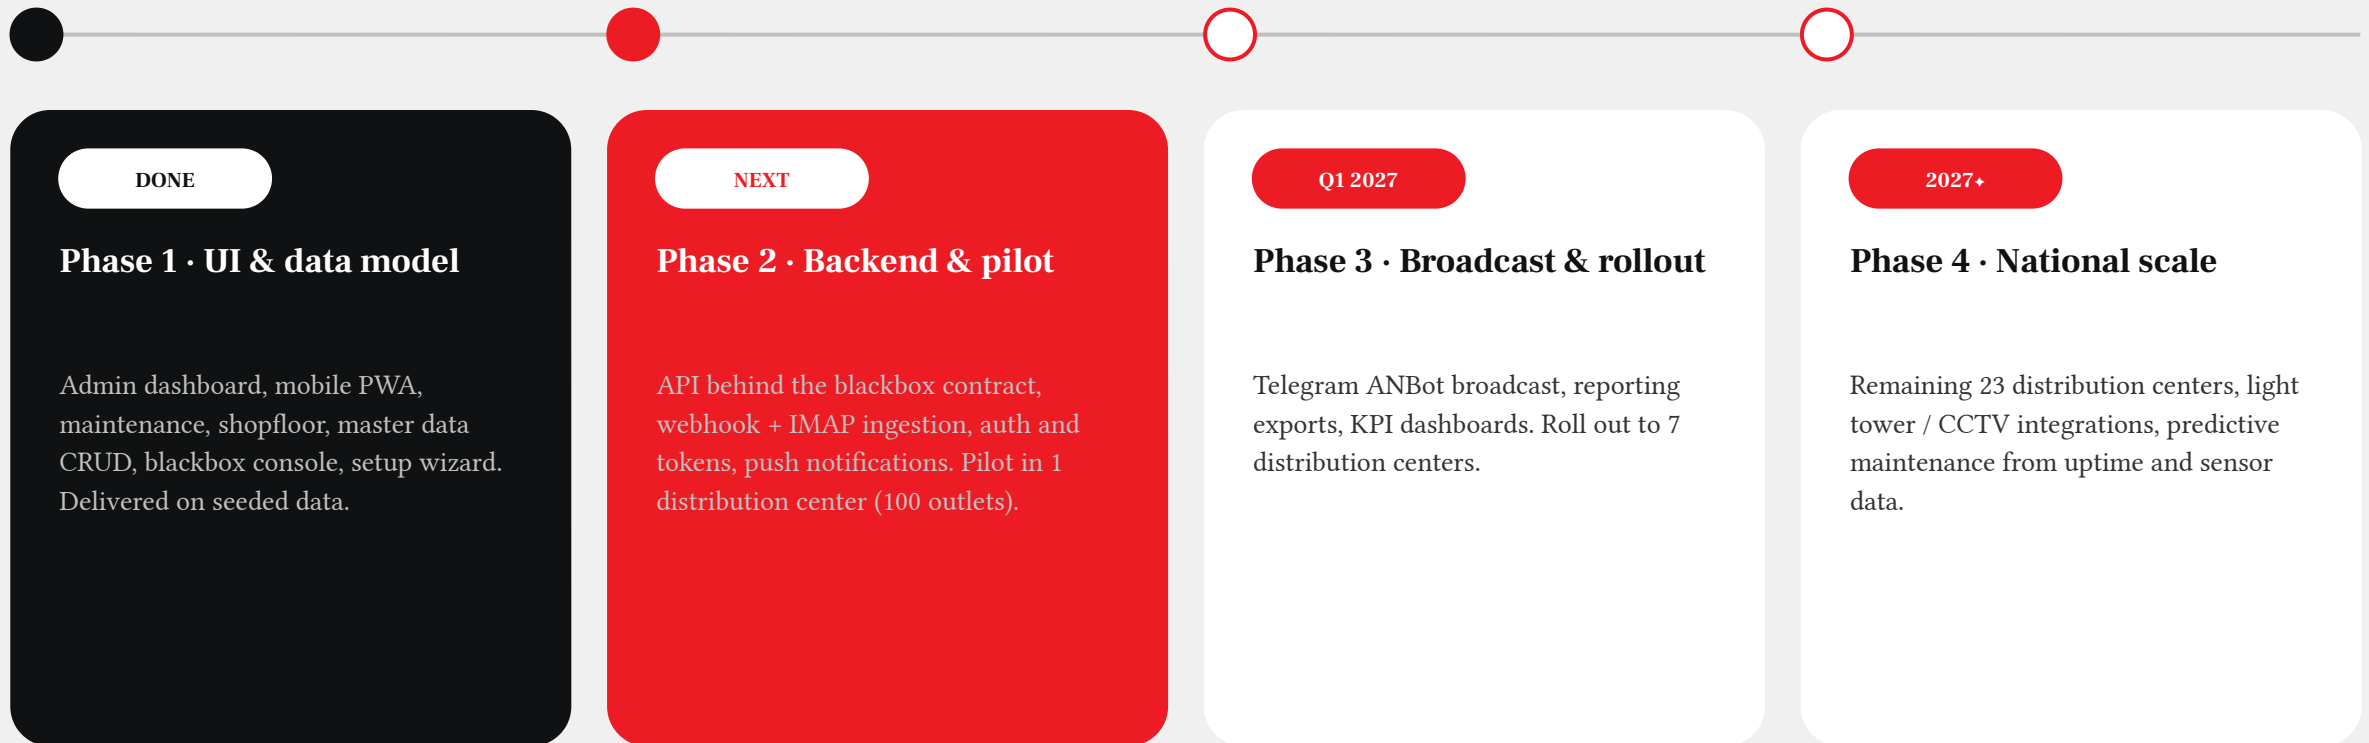

Shared packages

- types — domain model
- fixtures — seeded data + session reducer
- ui — component kit
- integration — API blackbox
- tailwind-config — theme

Next: backend

- Implements the blackbox contract
- Webhook + IMAP ingestion
- Push (FCM) and Telegram bot
- Auth, tokens, RBAC
- PostgreSQL + reporting

Delivery **phases.**

WIT.

Make IT Happen.

Let your outlets tell you before something goes wrong. RA Monitor — realtime environment & security monitoring, delivered by WIT.ID.
